

# **Two-Way Coupled COAMPS Simulation of MJO**

**Sue Chen, Maria Flatau, and  
James Cummings**

**Naval Research Laboratory**

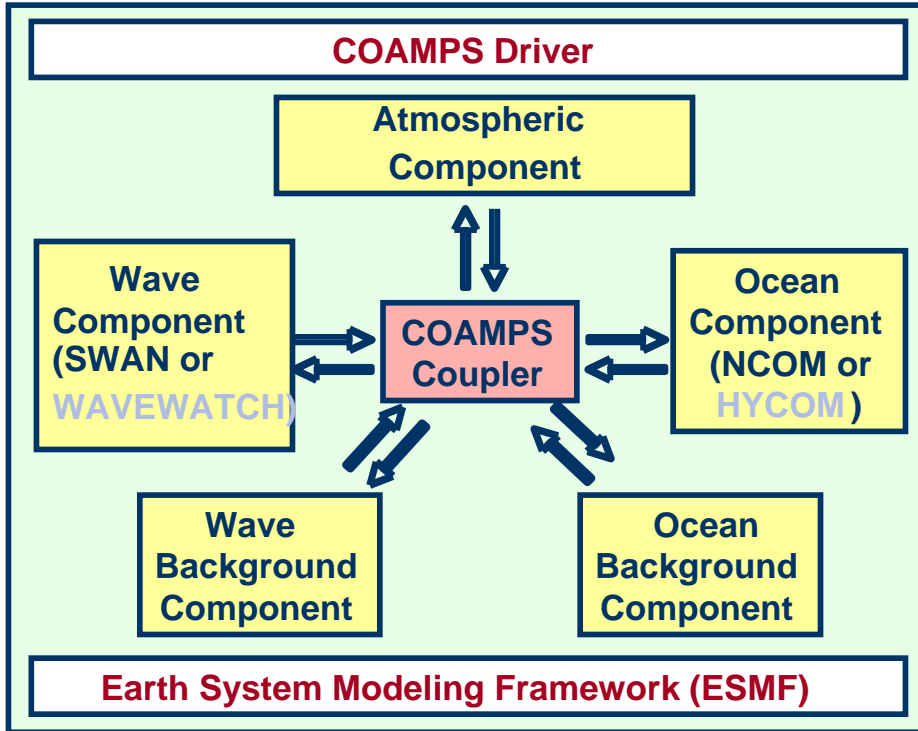

# Motivations

- **Can two-way tightly coupled limited area model bridge the gaps to improve the MJO forecast?**
- **What's the role of the air-sea interaction to the development of the MJO?**
- **Can we use the couple model to provide some observation guidance?**

# COAMPS®<sup>1</sup>

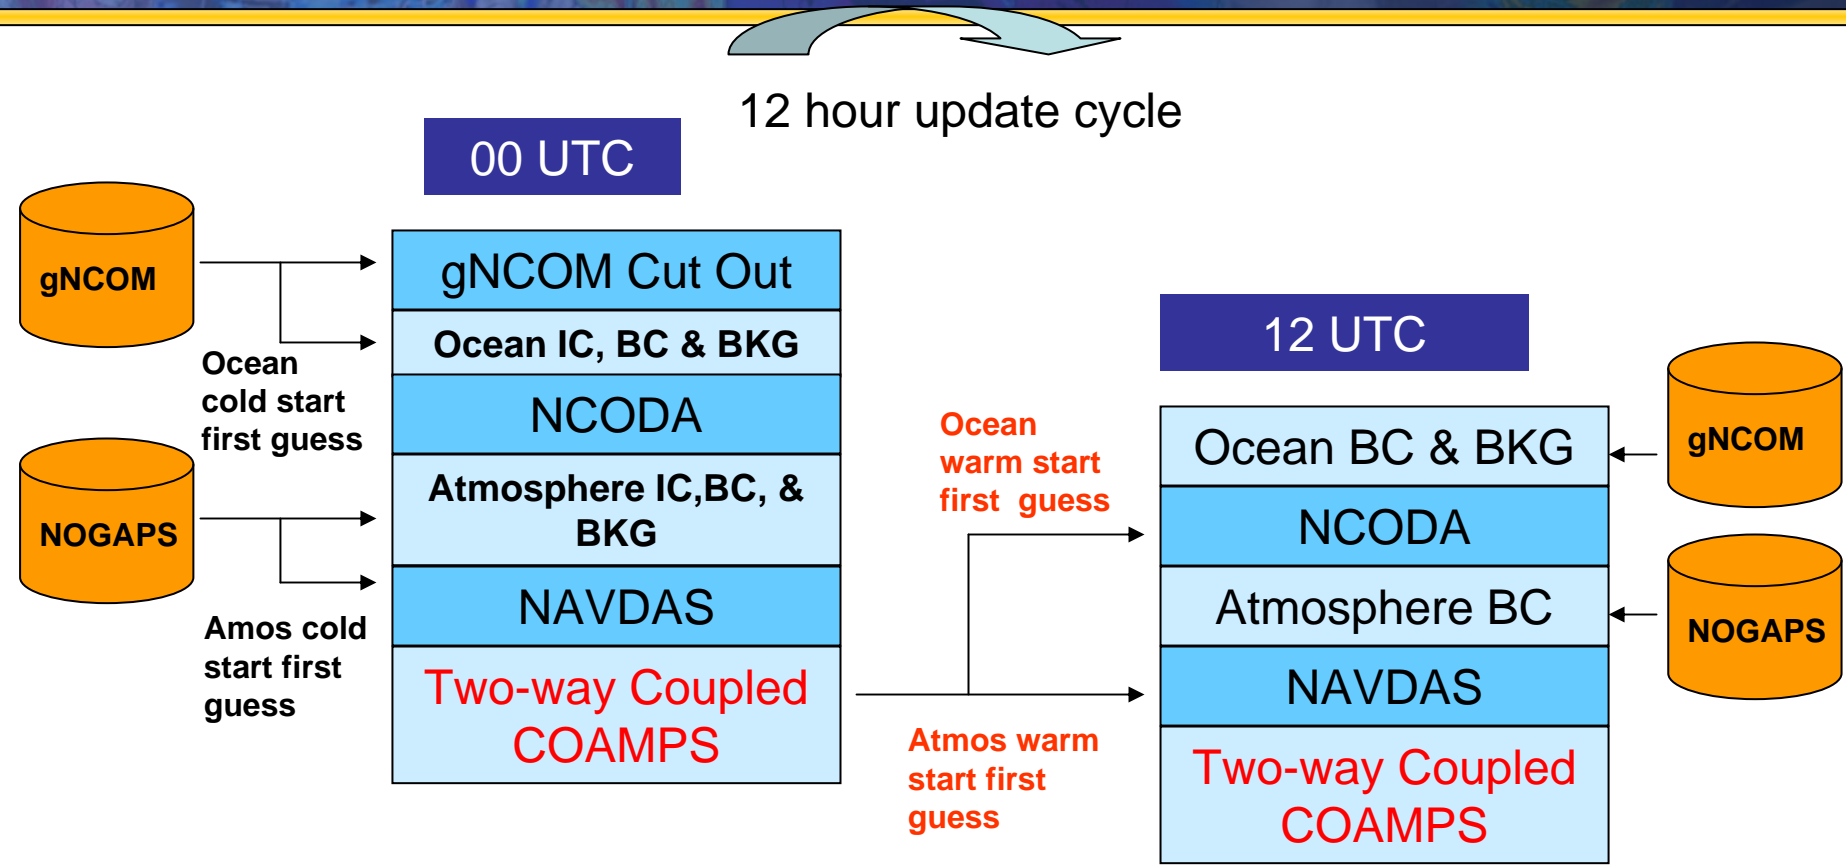

- ESMF super structure is used to couple the air, ocean, and wave components
- All data exchange between components is handled by a single multiphase coupler
- First NWP mesocale model that uses the ESMF coupling technology

<sup>1</sup>COAMPS® is a registered trademark of Naval Research Laboratory

# Two-Way Coupled Data Assimilation System

## COAMPS-NCOM, NAVDAS, and NCODA

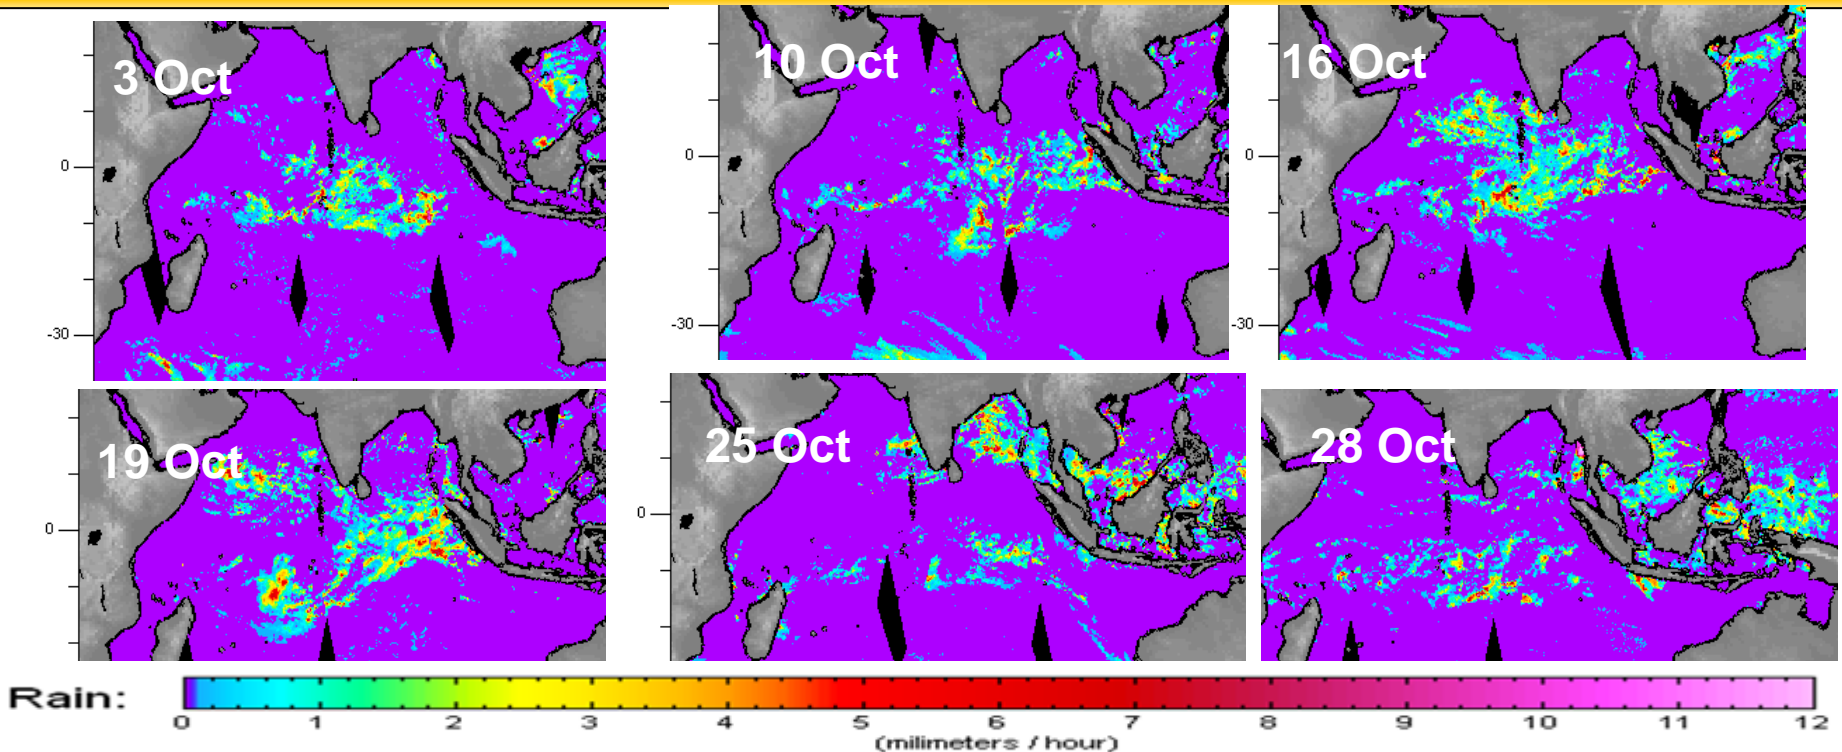

- The coupled data assimilation system ingests 6.7 Gbytes of observations and global model data for a 12 hour update cycle
- The atmosphere and ocean data assimilation system are two independent system

# An MJO Event

1-31 Oct, 2008

- 10 Oct: convection moves eastward to 90-120 E
- 16 Oct: convection retrieves back to 60-90 E
- 19 Oct: two twin tropical cyclones develop west of 60 E
- 25 Oct: convection quiets down in India Ocean
- 28 Oct: convection starts in Maritime Continent

# COAMPS MJO Simulation

## Model Setup

### *Coupled Model Configuration*

- 21 days continuous data assimilation in both the atmosphere (MVOI) and ocean (NCODA)
- Ocean assimilation include the altimeter data
- Twelve hour update cycle
- Two-nested atmospheric grids:
  - 45 and 15 km (201x151, 322x253)
  - 30 vertical levels
- One NCOM grid
  - 10 km (572x452)
  - 40 vertical levels, 23 sigma layers
- Coupling:
  - Concurrent mode
  - Coupling interval: 10 min

# Results

## Propagation of the MJO

### 24 H Accumulated Precipitation

16 Oct

19 Oct

25 Oct

Hourly Precipitation (mm/h): 16 Oct 2008

Hourly Precipitation (mm/h): 19 Oct 2008

Rain:

# Results

## Propagation of the MJO

### Precipitation (mm/hr)

- Convection moves eastward
- Rossby wave moves westward

# Results

## Upper Ocean Response

SST Climate Anomaly (C)  
09 Oct 06 00Z Tau 000 10 km grid

9 Oct

SST Climate Anomaly (C)  
16 Oct 06 00Z Tau 000 10 km grid

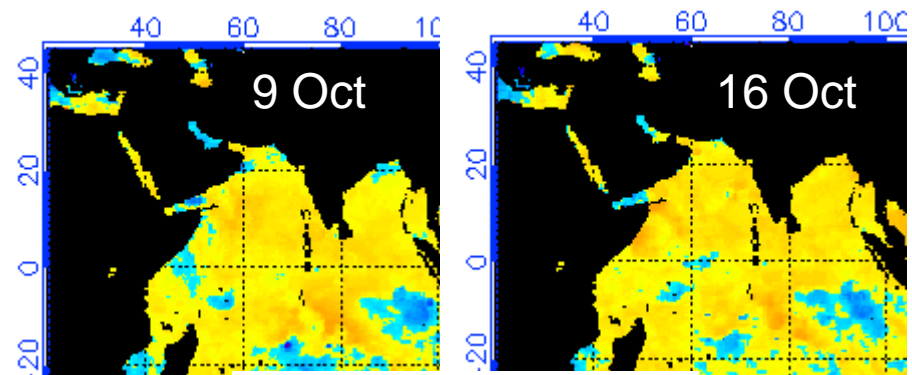

16 Oct

20 Oct

Twin TC cold wake

NOAA/NESDIS SST Anomaly

20 Oct

# Results

## Upper Ocean Response

20 Oct: Total surface stress

# MJO Modeling Strategy

- Tropical belt  
(Tommy Jensen, NRL SSC)
- Basin Scale

High resolution moving domains

# Futures Plans

- **Finish analyzing the coupled model results**
- **Extend the forecast to five days and add higher resolution over the convective region**
- **Perform uncoupled and 1-way coupled simulations to study the impact of air-sea interaction to the development of MJO**
- **Examine the impact of ocean data assimilation to model forecast OML structure**
