## The South Atlantic volume flux divergences

## The South Atlantic branch of the global thermohaline circulation

---

## Summary

$T < 10$  years

---

- *Analysis of satellite data suggests that the geostrophic component of the SA circulation has a substantial influence in the low-frequency ( $T >$  month) structure of the SST variability.*

---

$T > 10$  years

---

- *Model results suggest that the meso-scale variability of South Atlantic circulation actively contributes to the global water mass conversions.*
