Aerosol size distributions – nucleation to coarse mode

Dave Rogers, NCAR/RAF

Aerosols & TORERO science goals

- *Vertical distribution of aerosol particles*
- *Stable layers & stratification*
 - *characterize structures shown by HSRL*
- *Sources, transport & mixing of particles*
 - *especially new formation*
 - *association with trace gas data*
- *Scavenging/removal processes*

Aerosol instruments

UHSAS – *Ultra-High Sensitivity Aerosol Spectrometer*

- 60 – 1,000 nm in 100 size bins, 10 sps
- Size resolution ~1%

Water-based CN counter (WCN)

- total conc, particles > ~7 nm
- 10 sps
- ~1 sec response
- use 2 WCN with different thresholds

7 nm and 30 nm = *development project*

Aerosol instruments

two WCN in cabin

Operator reminder → **Log positions of 3-way valves on chat!**
Typical = AD or CF

Aerosol diffusion battery

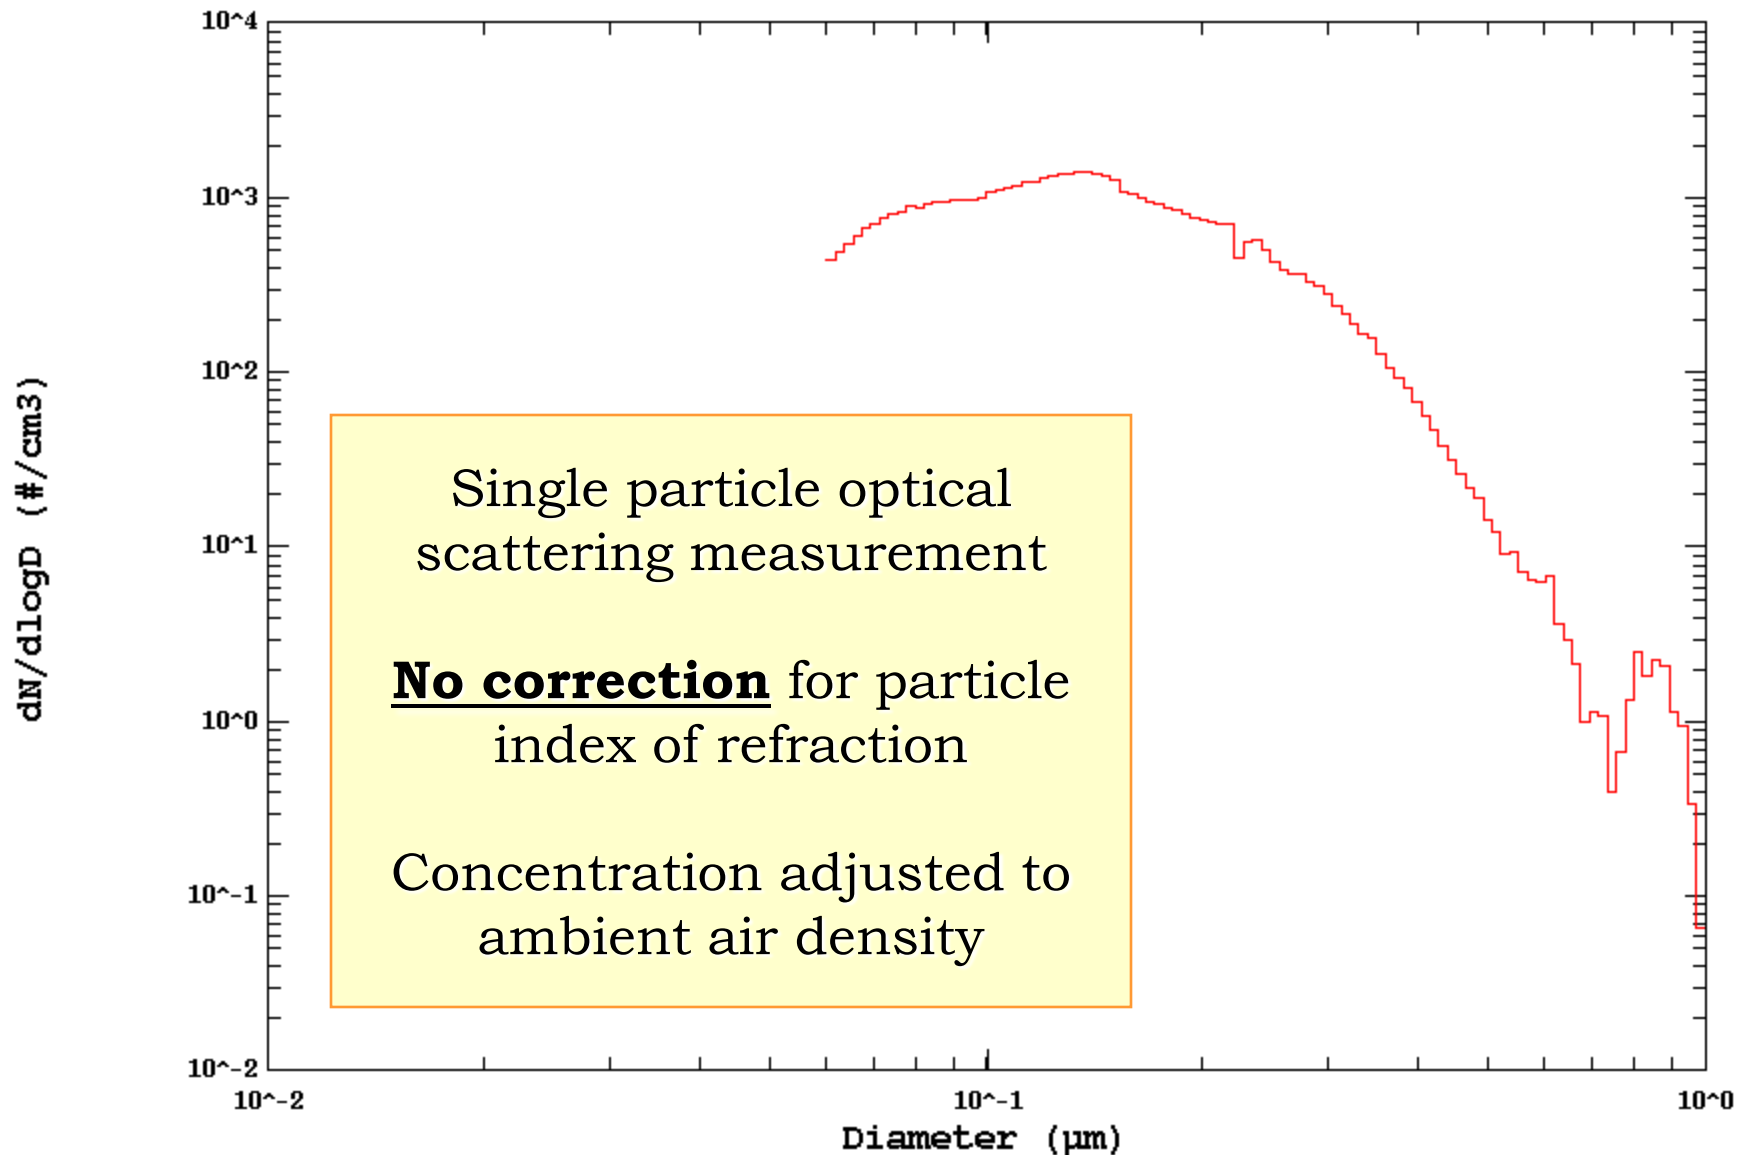

- removes smallest particles
- stack of 8 screens 100 μm mesh

fractional penetration of aerosol through diffusion battery with 8 screens

| | | particle diameter (μm) | | | | | | | |
|----------------|------|-------------------------------------|-------|-------|-------|-------|-------|-------|-------|
| | | 0.010 | 0.014 | 0.020 | 0.027 | 0.038 | 0.054 | 0.075 | 0.105 |
| pressures (mb) | 150 | 0.012 | 0.058 | 0.161 | 0.309 | 0.470 | 0.613 | 0.727 | 0.812 |
| | 200 | 0.026 | 0.095 | 0.221 | 0.379 | 0.534 | 0.666 | 0.767 | 0.840 |
| | 300 | 0.060 | 0.165 | 0.314 | 0.474 | 0.617 | 0.731 | 0.814 | 0.873 |
| | 400 | 0.098 | 0.225 | 0.383 | 0.538 | 0.669 | 0.770 | 0.842 | 0.891 |
| | 500 | 0.135 | 0.276 | 0.436 | 0.585 | 0.706 | 0.796 | 0.860 | 0.904 |
| | 600 | 0.169 | 0.319 | 0.478 | 0.620 | 0.733 | 0.815 | 0.873 | 0.912 |
| | 700 | 0.200 | 0.355 | 0.513 | 0.648 | 0.754 | 0.830 | 0.883 | 0.919 |
| | 800 | 0.229 | 0.387 | 0.541 | 0.671 | 0.770 | 0.842 | 0.891 | 0.924 |
| | 900 | 0.255 | 0.415 | 0.566 | 0.690 | 0.784 | 0.851 | 0.897 | 0.928 |
| | 1000 | 0.280 | 0.439 | 0.587 | 0.707 | 0.796 | 0.859 | 0.902 | 0.931 |

UHSAS size distribution measurement – 10 Hz

UHSAS tracks WCN's *RF02 - Jan 27*

Question: are WCN equivalent?

change 3-way valves to flip/flop WCN

Total history – RF02

Altitude,
Temp, dewpt

clouds at
MBL
inversion

aerosols

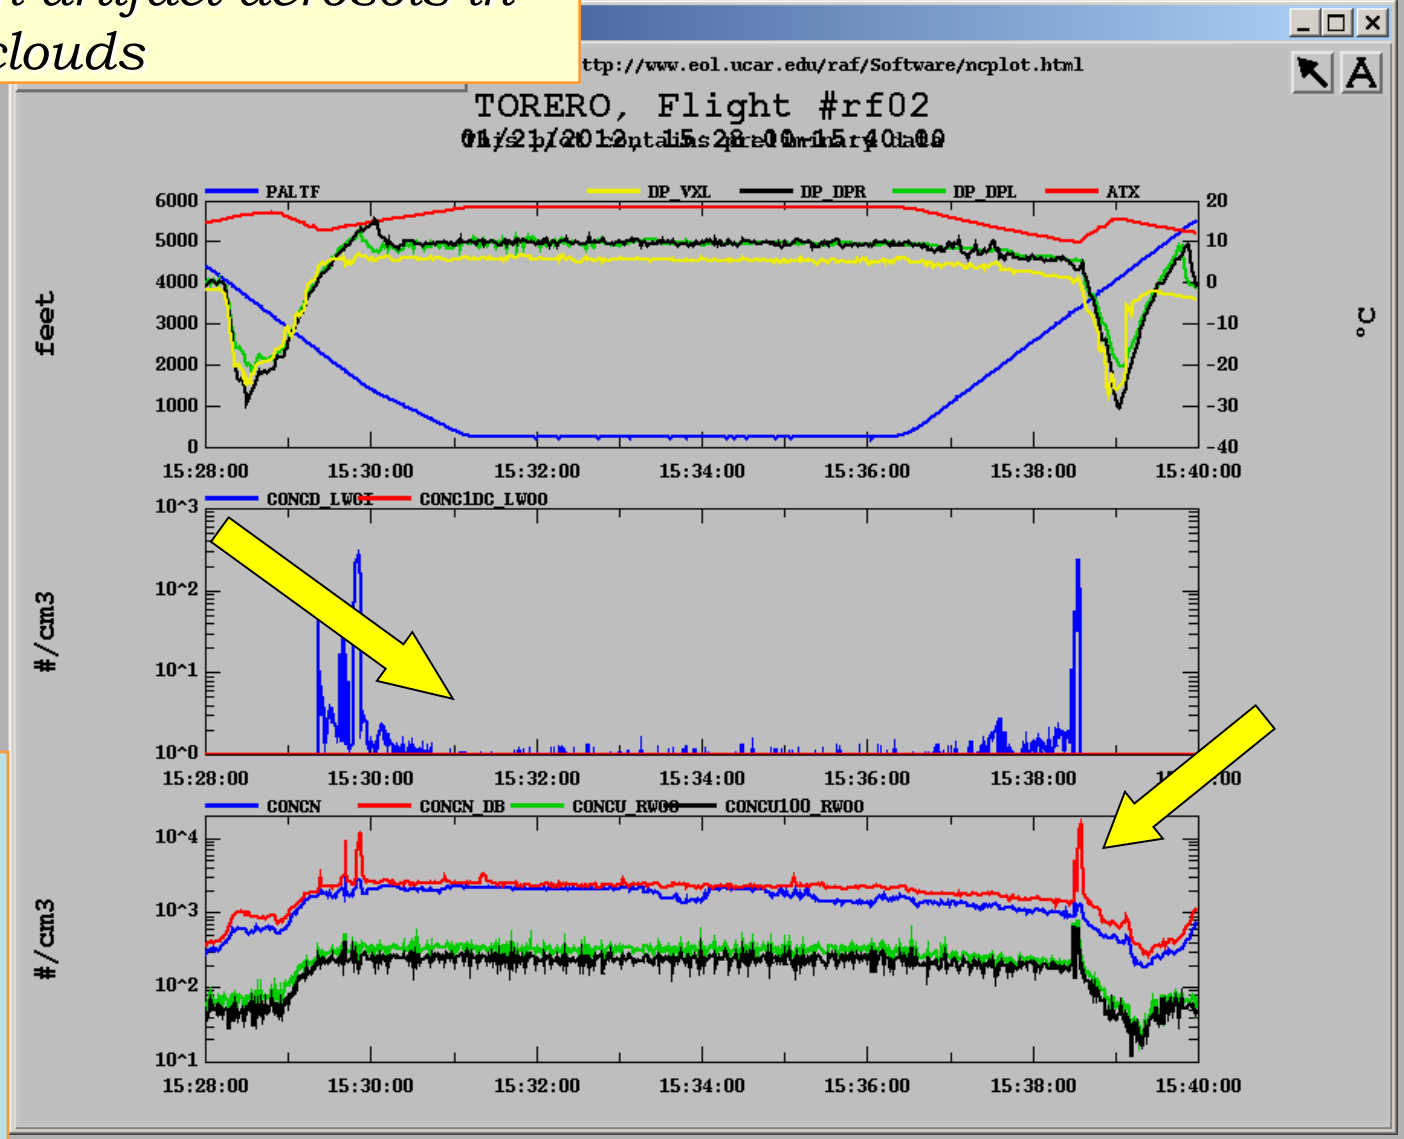

Caution: splash artifact aerosols in clouds

altitude, temp, dewpt → inversion

aerosol > 1μm in BL detected by CDP

Aerosol conc greater in BL.
spike in clouds = sampling artifact

UHSAS – *how to recognize bad data?*

→ **USCAT** saturated 4.1 v

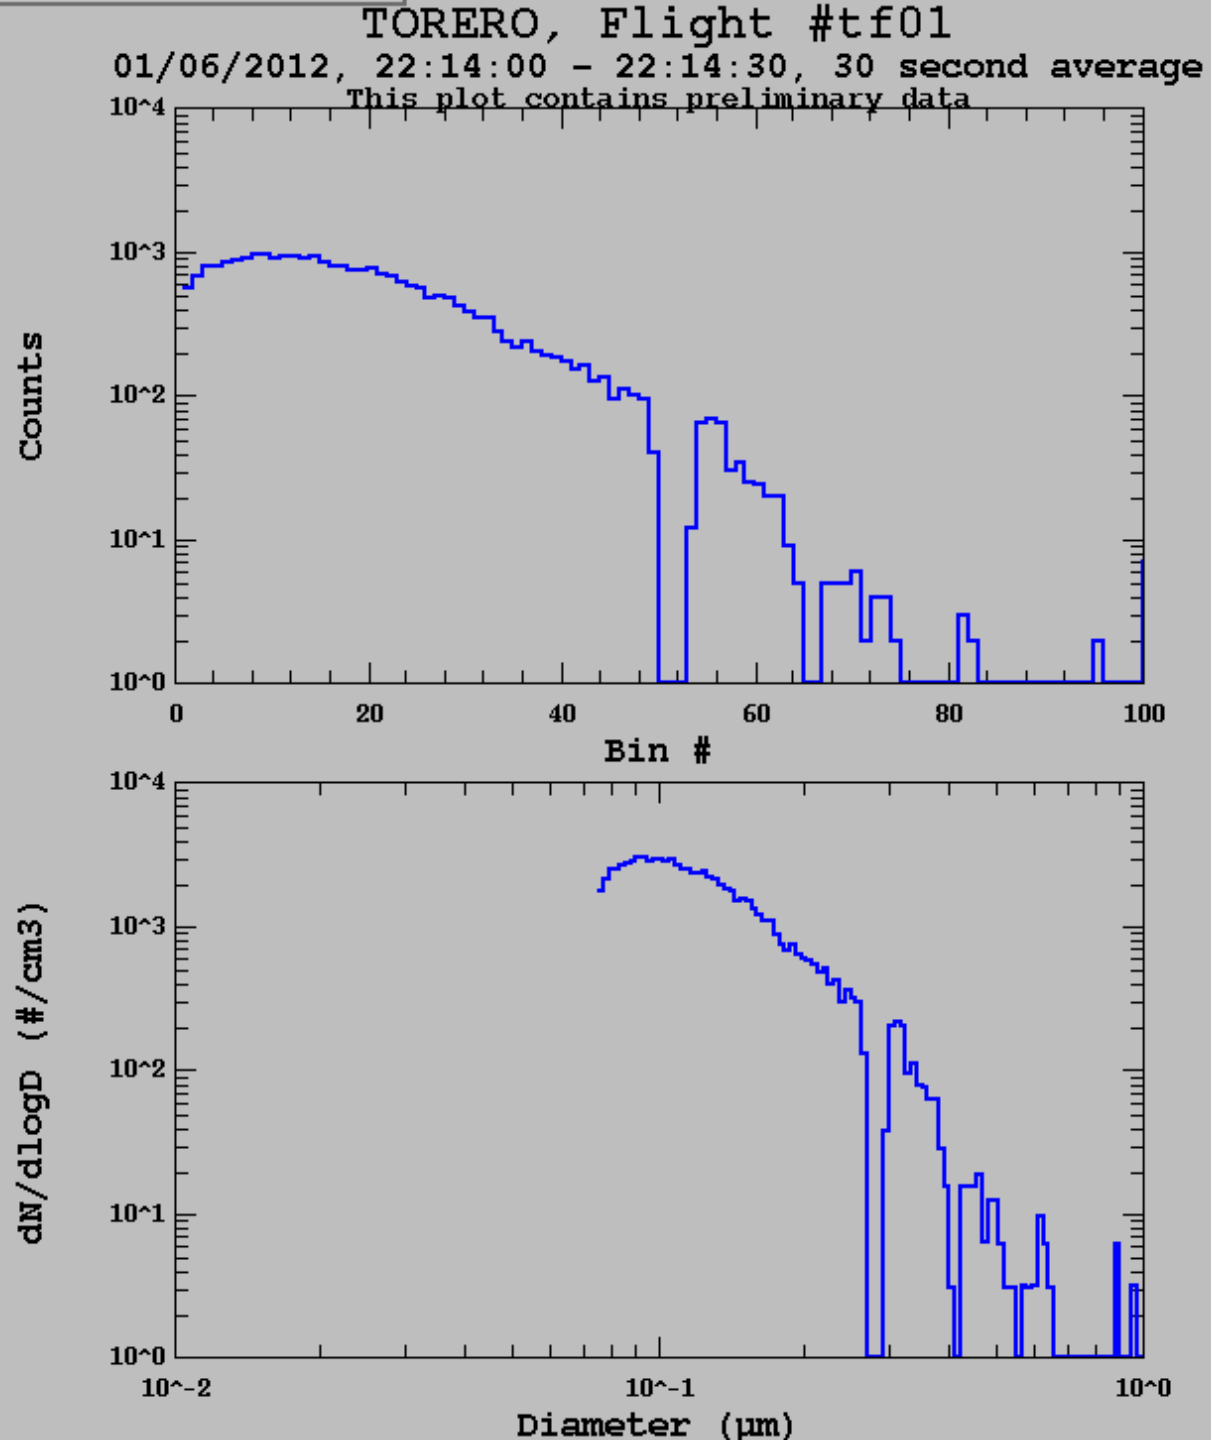

TORERO, Flight #rf04

01/27/2012 12:45:00 - 21:17:44

UHSAS – *how to recognize bad data?*

→ *size distribution unrealistic gaps & bumps*

UHSAS flight measurements

<http://www.eol.ucar.edu/~dcrogers/TORERO/uhsas/>

| date | flight # | UHSAS |
|--------|----------|---------|
| 19-Jan | RFO1 | ok |
| 21-Jan | RFO2 | ok |
| 24-Jan | RFO3 | ok |
| 27-Jan | RFO4 | bad 40% |
| 29-Jan | RFO5 | ok |
| 31-Jan | RFO6 | ok |
| 3-Feb | RFO7 | ok |
| 4-Feb | RFO8 | ok |
| 7-Feb | RFO9 | ok |
| 10-Feb | RF10 | ok |
| 12-Feb | RF11 | ok |
| 14-Feb | RF12 | ok |
| 17-Feb | RF13 | bad 90% |
| 19-Feb | RF14 | ok |
| 22-Feb | RF15 | ok |
| 24-Feb | RF16 | ok |
| 26-Feb | RF17 | ok |

→ aerosol data in netcdf files

Analysis In Progress

A. Quality assessment for UHSAS & WCN

B. Regions of enhanced/suppressed aerosol concentrations.

Aerosols as tracers

Connections to airmass (thermodynamic markers)

Probing structures revealed by HSRL

Relation to trace gas data & photolytic production

C. Can we identify regions with new particle generation $\sim 7 - 30$ nm ?

- *compare WCN's & diff. battery data*

- *position of 3-way valves in log books & chat logs*

D. Effects of clouds on particle removal, scavenging
